Business Description:

We run a veterinary home visit service called Vet Doctor. Our business connects pet owners and farmers with licensed veterinary doctors who travel to the customer's home or farm to treat their animals. We currently manage bookings manually, which limits efficiency and organization, and we want a developer to build us a proper online system to handle this more efficiently and improve service management, accessibility, and overall customer experience.

Our customers are people who own pets such as dogs, cats, birds, and rabbits, as well as farmers who have livestock like sheep, goats, and cows. Instead of making them bring their animals to a clinic, we send the vet directly to them. This is what makes our service different.

we have two main groups of customers:

- (1) pet owners who have animals like dogs, cats, birds, and rabbits,
- (2) farmers in who have animals such as sheep, goats, cows, and chickens.

What services the business offers?

- Home Visit Booking: Clients book a vet to visit their home or farm at a chosen date and time.
- Emergency Visit Requests: Urgent bookings for sick or injured animals requiring prompt attention.
- Routine Check-Ups: Scheduled periodic health examinations, vaccinations, and preventive care.
- Payment options: cash or online payment
- Extra features: search for a nearby vet, how-to guides for booking, and information about why to choose the service
- Online consultation (chat or video/phone call)
- Affordable pet treatment packages for different health issues
- the client can book at any time .
- Vet Profile Browsing: Clients can view veterinarian specializations, ratings, reviews, and availability calendars.
- For the maneger he can se reports foe each month sells and booking schedule and each vet gain

Business Capacity

Our current business handles a moderate but growing workload.

- Around 100 to 300 customers served per month
- 20 to 50 bookings handled per day
- Supports multiple types of animals (both pets and farm animals)
- Multiple veterinarians can work at the same time
- The system scales as the number of users and vets grows

As the business continues to grow, we expect the number of customers and veterinarians to increase, and therefore require a scalable system that can support this growth.

How the Business Works

1. The customer creates an account.
2. The customer selects the type of service needed (e.g., check-up, emergency, farm visit).
3. The customer enters their location and preferred date and time.
4. The system assigns a veterinarian automatically, or the customer can choose a specific one.
5. The veterinarian travels to the customer's home or farm and provides the service.
6. The service is completed and the vet uploads visit notes or a prescription.
7. The customer makes payment (cash or online).
8. The customer can leave a rating or feedback about the service.

Revenue Model

Our business follows a combination of pricing strategies to generate revenue.

- Each service has a fixed price depending on its type, such as regular check-ups, emergency visits, or farm services.
- In addition, we may offer optional packages or subscription plans that allow customers to receive multiple services over a period of time at a discounted rate, which helps ensure stable and predictable income.
- additional charges may apply for extra services such as laboratory tests, specialized treatments, or medications.
- The business collects payments from customers and pays veterinarians, while keeping part of the money as profit.

Employees and Their Roles

Administrator

Veterinarians

Customer Support

Role	Responsibilities	number
Administrator	Responsible for managing the overall system, approves vet registrations, monitors bookings, and makes sure everything works good	1 member
Veterinary Doctors	Provide treatment and medical services during home or farm visits. They also upload visit notes and prescriptions after each appointment.	3-10
Customer Support	Handles customer booking , questions, complaints, cancellations, and any issues that come up during or after a booking.	2–4 staff

Current Business Environment

Currently, our business operates using phone communication and basic tools, but we are planning to transition to a fully integrated online system.

We serve both urban areas (mainly pet owners) and rural areas (farmers). At present, customers contact us through phone calls or a basic website, which limits bookings to working hours only and does not allow customers to book services at any time.

Additionally, there is no proper system to track appointments in real time. For example, we cannot easily confirm whether the veterinarian has arrived at the scheduled location or not, which may lead to delays or misunderstandings.

We also face challenges in communication and follow-up between veterinarians and customers after the visit, as there is no centralized system to manage updates, notes.

Our goal is to develop a system that integrates booking management, veterinarian coordination, payment processing, and customer feedback into one unified platform, while also improving tracking, communication, and service availability.
